## 1. Emulated games

There are few good native Linux games, but there are a emulators available that lets you play a huge number of games made for other systems.

<http://www.abandonware.org> and <http://gamebird.dk/> are site where you can download old games.

### 1.1. Commodore 64

Emulators:

- [Frodo - The free portable C64 emulator](#)
- [VICE](#)

Games/Roms:

- [c64unlimited](#)

### 1.2. Playstation 1

[ePSXe Playstation Emulator](#) (epsxe) is the best Linux emulator for playing Playstation games. [pcsx](#) (pcsx) is another alternative.

Both of these need seperate plugins to handle sound, video and gamepads.

- Sound: [P.E.Op.S Sound Emulation SPU PSEmu Plugin](#) (psemu-peopsoftgpu)
- Video: [P.E.Op.S Software GPU plugin](#) (psemu-peopsoftgpu)

## Games (Linux Reviews)

- Joystick: [padJoy](#) (psemu-padjoy) or [padxwin](#) (psemu-padxwin)

With a USB2PSX converter from [Rockfire](#) you can even play the Playstation games with an original gamepad.

### 1.3. Playstation 2

The [pcsx2 Playstation2 emulator](#) is getting there, step by step. It can be used, but do expect bugs and crashes.

### 1.4. MAME

With [MAME](#), Multiple Arcade Machine Emulator, you can play all those great old arcade games. Some of them are quite fun. You also want [GXMame](#), a very nice frontend that lets you select games and configure mame from a GUI interface. [AdvanceMENU](#) is another good frontend.

Check out the newsgroup `alt.binaries.emulators.mame` on usenet for games.

## 1.5. Super Nintendo

ZSNES is a great Super Nintendo emulator.
