

txt2tags 2.0 is released. txt2tags is a single python script that converts text files with minimal markup to into formatted HTML, SGML and other document formats.

2004-07-25

The new version adds (valid) XHTML support and better support for images and css. mgp, moin and man targets are improved. Some of the markup tags have been changed and documents created for 1.x must be converted.

txt2tags is a single python script that converts text files with minimal markup to into formatted HTML, SGML and other doc

This website is made
using txt2tags for two
reasons:

- Any OS and editor can be used to edit the files
- It is possible to create a huge number of formats using the text-files, txt2tags now supports creating HTML, SGML, LaTeX, manual pages, MoinMoin, Magic Point and PageMaker 6.0 documents.

2.0 uses slightly different markup and comes with a small tool to convert 1.x documents.

txt2tags 2.0 is released. txt2tags is a single python script that converts text files with minimal markup to into

The latest KDE 3.3cvs version of the popular text editor kate features a txt2tags markup highlight mode. It makes lists yellow and hard to read on the default white background, links blue and **bold** tags become bold. Quite nice, except for the *yellow* lists.

Get the latest version and find out why people love txt2tags. txt2tags is a single python script.
