

New version of the popular KDE office suite KOffice Released

LinuxReviews.org

Koffice 1.3.3 fixes numerous bugs reported since last release. Much work has been done to improve the various import and export filters, making it easier to exchange files between KOffice and other office packages.

Also, a new Welsh (cy) translation has been added.

The latest stable version attempts to be just that: Stable, and has few new features. The development branch and upcoming major Koffice release, however, has many great improvements planned. The devel version of KWord is already capable of copying and pasting anything that follows the OASIS standard, like formatted text, tables and pictures.
