

GIMP 2.2.4 released, mainly a bug fix release

LinuxReviews.org

The GNU Image Manipulation Program is a very popular paint and image manipulation program for Linux. The 2.2 series is based on GTK2 and has a lot of new nice features compared to the 1.x series. 2.2.4 is mainly a bug fix release for version 2.2.

GIMP may look like a simple program at first glance, but once you get to know the tool you will find that it has more than half of all the features who are available in commercial packages sold for other operating systems. This may not be enough for extremely professional users, but it has more to offer than the average user needs.

There are a great number of great tutorials for Gimp available for both novice and experienced users.

GIMP 2.2.4 released, mainly a bug fix release (Linux Reviews)

Gimp v2.2.4

New "Improved" file-dialog

From the Changelog:
