

fe3d v0.8-2 available

LinuxReviews.org

fe3d is a multiplatform sdl/opengl based nmap log visualizer. Most of the changes are internal code fixes and cleanups that might make it perform up to twice as fast on some systems compared to the previous version.

Nmap is the ideal tool for checking your own security as well as finding random exploitable systems on the Internet.

fe3d is a handy tool that visualizes the log output from Nmap. It still only works well with nmap -sS. fe3d is definitively worth a look if you use nmap regularly.
