

Learning Touch can be fun with KTouch

lr

KDE 3.4 will come bundled with a huge amount of free programs. Ktouch is one of them, and the new version has as usual evolved slightly better than the previous version. Learning touch can be fun and as a bonus teach you new interesting words. Try ktouch.

Ktouch has been available in KDE for years and you probably have it installed. Try it.

It is a very useful program that makes typing go slightly easier for every time you have used it for half an hour.

Increase the levels as the weeks of using it half an hour a week pass on.

You will soon find that you have learned both to type faster and that you also have learned many interesting new words.
