

KDE 3.4.1 released

LR

KDE 3.4 still had some bugs and issues to fix when it was released. 3.4.1 is a polished version with a few bugs ironed out.

All KDE users will enjoy a upgrade which silently removes a lot of very annoying bugs. 3.4.1 also has a lot better translation support for many languages as the language translators now have had a long time to fully complete their work.

KDE 3.4.1 has many fixes to khtml which is used to present HTML content in Konqueror and many other KDE programs. Konqueror itself has also been improved with 10 bugs closed. The best PDF viewer available for Linux, KPDF, has also become a lot more stable with 19 bugs closed.

Packages are available for Redhat/Fedora, Suse, Slackware and Conectiva Linux.
