

# GIMP 2.2.8 Released

*Thank you for reading Linux Reviews.*

Version 2.2.8 of the GNU Image Manipulation Program is now available for download. This is a bug-fix release in the stable 2.2 series that fixes memory leaks, plug-in bugs and many win32-specific bugs.

GIMP is the best image manipulation program for Linux. It is also available for Windows. GIMP is very much like Photoshop, but lacks many of the more advanced features found in commercial solutions.

The stable branch of Gimp, 2.2.x, is getting more stable with this new version which fixes some bugs. Try the latest GIMP development version, 2.3.1, if you are brave enough to try out the usually buggy bleeding edge version of Gimp.

You can download the source code from <ftp.gimp.org> and its mirrors or distributions installation tools to try Gimp.

CHangelog:

## **Bugs fixed in GIMP 2.2.8**

- fixed possible crash in plug-ins-query PDB function
- fixes to Script-Fu server mode on Win32
