Qt 4.0 released by Trolltech

KDE and QT are cool things!

Trolltech has now chosen to release Qt 4.0 under both commercial and GPL licenses on MS Windows, Mac OS X and Linux/X11. This is the first time they have made a GPL version of QT available for Windows.

The Trolltech employees have made [a music video](#) to celebrate the release. You can download it using [BitTorrent](#) ([Ogg version](#)).

[QT](#) is the foundation of KDE, the desktop and the huge abundance of software available for it would not have been possible without the underlying QT libraries. The next generation [KDE desktop](#), 4.0, is already under way and will be based on version 4.0 of the QT libraries.

The Opera Web Browser is based on QT.

The popular light web browser [Opera](#) is a good example of what is possible to do using the QT toolkit.

The license change now makes it possible to develop multi-platform GNU-licensed software capable of running on Linux, Windows and Mac using QT.

Download QT 4.0:

- <ftp.trolltech.com>
- [trolltech mirrors](#)
