Mupper v3.0 Rescue-CD for pegasos computers available

LR

Mupper is a rescue live-CD project for PegasosPPC based on Gentoo Linux. It has all the important tools like parted and midnight-commander and it supports all common filesystems like FAT, VFAT, ReiserFS, XFS and EXT3 (but not SFS).

Mupper also contains important networking tools like tcpdump ([manual](#)) and snort.

Mupper is the birth-child of Mikael Karlsson, aka lisarden and obviously, like almost all other open source projects, many other contributors.

Having a rescueCD is generally a very good idea indeed because that is just the thing you never realize you do not have available until your desperately need it.

The CD is specially created with the [Genesis Open Desktop Workstations](#) read-to-use-gentoo-linux computers, but the CD is highly useful to anyone facing a non-working or badly broken Linux-system.
